I'm building a cloud networking architecture

In this hands-on networking series, I'm learning about networking. By the end of the 9 projects, I will have a vast knowledge on networking and I'm learning about cloud networking because it's a very important aspect of my DevOps journey.

Businesses traditionally had to manage physical network hardware on-site. Cloud networking changed things by moving networking infrastructure to the cloud, where it can be managed virtually.

Excited to share my progress - build a VPC with me!

I will set aside 2-3 hours every week to work on this networking series. I will keep myself accountable by setting weekly goals and tracking my progress after each session.

What are networks?

Computer networks are collection of devices that can exchange data packets.

What is a VPC?

A VPC is a private network created in the cloud where an organization's resources, such as servers and databases, can securely communicate. This helps organizations by keeping their cloud resources isolated, secure, and easy to manage while still allowing internet access when needed.
